Documentation Classifications
In order to assist in the use of this product, Giga Computing provides the following types of documentation:

- User Manual: detailed information & steps about the installation, configuration and use of this product (e.g. motherboard, server barebones), covering hardware and BIOS.
- User Guide: detailed information about the installation & use of an add-on hardware or software component (e.g. BMC firmware, rail-kit) compatible with this product.
- Quick Installation Guide: a short guide with visual diagrams that you can reference easily for installation purposes of this product (e.g. motherboard, server barebones).

Please see the support section of the online product page to check the current availability of these documents.

Server Warnings and Cautions
Before installing a server, be sure that you understand the following warnings and cautions.

⚠️ **WARNING!**
To reduce the risk of electric shock or damage to the equipment:
• Do not disable the power cord grounding plug. The grounding plug is an important safety feature.
• Plug the power cord into a grounded (earthed) electrical outlet that is easily accessible at all times.
• Unplug all the power cords from the power supplies to disconnect power to the equipment.

⚠️ Shock Hazard! Disconnect all power supply cords before servicing.
• Do not route the power cord where it can be walked on or pinched by items placed against it. Pay particular attention to the plug, electrical outlet, and the point where the cord extends from the server.

⚠️ **WARNING!**
To reduce the risk of personal injury from hot surfaces, allow the drives and the internal system components to cool before touching them.

⚠️ **WARNING!**
This server is equipped with high speed fans. Keep away from hazardous moving fan blades during servicing.

⚠️ **WARNING!**
This equipment is intended to be used in Restrict Access Location. The access can only be gained by Skilled person. Only authorized by well trained professional person can access the restrict access location.

⚠️ **CAUTION!**
• Do not operate the server for long periods with the access panel open or removed. Operating the server in this manner results in improper airflow and improper cooling that can lead to thermal damage.
• Danger of explosion if battery is incorrectly replaced.
• Replace only with the same or equivalent type recommended by the manufacturer.
• Dispose of used batteries according to the manufacturer’s instructions.
Electrostatic Discharge (ESD)

CAUTION!
ESD CAN DAMAGE DRIVES, BOARDS, AND OTHER PARTS. WE RECOMMEND THAT YOU PERFORM ALL PROCEDURES AT AN ESD WORKSTATION. IF ONE IS NOT AVAILABLE, PROVIDE SOME ESD PROTECTION BY WEARING AN ANTI-STATIC WRIST STRAP ATTACHED TO CHASSIS GROUND -- ANY UNPAINTED METAL SURFACE -- ON YOUR SERVER WHEN HANDLING PARTS.

Always handle boards carefully. They can be extremely sensitive to ESD. Hold boards only by their edges without any component and pin touching. After removing a board from its protective wrapper or from the system, place the board component side up on a grounded, static free surface. Use a conductive foam pad if available but not the board wrapper. Do not slide board over any surface.

System power on/off: To remove power from system, you must remove the system from rack. Make sure the system is removed from the rack before opening the chassis, adding, or removing any non hot-plug components.

Hazardous conditions, devices and cables: Hazardous electrical conditions may be present on power, telephone, and communication cables. Turn off the system and disconnect the cables attached to the system before servicing it. Otherwise, personal injury or equipment damage can result.

Electrostatic discharge (ESD) and ESD protection: ESD can damage drives, boards, and other parts. We recommend that you perform all procedures in this chapter only at an ESD workstation. If one is not available, provide some ESD protection by wearing an antistatic wrist strap attached to chassis ground (any unpainted metal surface on the server) when handling parts.

ESD and handling boards: Always handle boards carefully. They can be extremely sensitive to electrostatic discharge (ESD). Hold boards only by their edges. After removing a board from its protective wrapper or from the system, place the board component side up on a grounded, static free surface. Use a conductive foam pad if available but not the board wrapper. Do not slide board over any surface.

Installing or removing jumpers: A jumper is a small plastic encased conductor that slips over two jumper pins. Some jumpers have a small tab on top that can be gripped with finger-tips or with a pair of fine needle nosed pliers. If the jumpers do not have such a tab, take care when using needle nosed pliers to remove or install a jumper; grip the narrow sides of the jumper with the pliers, never the wide sides. Gripping the wide sides can damage the contacts inside the jumper, causing intermittent problems with the function controlled by that jumper. Take care to grip with, but not squeeze, the pliers or other tool used to remove a jumper, or the pins on the board may bend or break.
CAUTION!
Risk of explosion if battery is replaced incorrectly or with an incorrect type. Replace the battery only with the same or equivalent type recommended by the manufacturer. Dispose of used batteries according to the manufacturer’s instructions.

Chapter 1  Hardware Installation

1-1  Installation Precautions

The motherboard/system contain numerous delicate electronic circuits and components which can become damaged as a result of electrostatic discharge (ESD). Prior to installation, carefully read the user manual and follow these procedures:

- Prior to installation, do not remove or break motherboard S/N (Serial Number) sticker or warranty sticker provided by your dealer. These stickers are required for warranty validation.
- Always remove the AC power by unplugging the power cord from the power outlet before installing or removing the motherboard or other hardware components.
- When connecting hardware components to the internal connectors on the motherboard, make sure they are connected tightly and securely.
- When handling the motherboard, avoid touching any metal leads or connectors.
- It is best to wear an electrostatic discharge (ESD) wrist strap when handling electronic components such as a motherboard, CPU or memory. If you do not have an ESD wrist strap, keep your hands dry and first touch a metal object to eliminate static electricity.
- Prior to installing the motherboard, please have it on top of an antistatic pad or within an electrostatic shielding container.
- Before unplugging the power supply cable from the motherboard, make sure the power supply has been turned off.
- Before turning on the power, make sure the power supply voltage has been set according to the local voltage standard.
- Before using the product, please verify that all cables and power connectors of your hardware components are connected.
- To prevent damage to the motherboard, do not allow screws to come in contact with the motherboard circuit or its components.
- Make sure there are no leftover screws or metal components placed on the motherboard or within the computer casing.
- Do not place the computer system on an uneven surface.
- Do not place the computer system in a high-temperature environment.
- Turning on the computer power during the installation process can lead to damage to system components as well as physical harm to the user.
- If you are uncertain about any installation steps or have a problem related to the use of the product, please consult a certified computer technician.

**NOTE!**

1. EC FW is broken or not exited result in Microchip CEC1702 cannot load EC FW for authentication.

2. (1) Authentication fail include below scenarios
   - Configuration table is missing or modified
   - Public key is missing or modified
   - Protected area or signature is modified
   - Flash empty

3. If active flash is still authentication failed after recovery sequence, Microchip CEC1702 stop the process and showing LED behavior.

4. If backup flash authentication is failed cause by configuration table, public key or protected area is broken. Microchip CEC1702 stop the process and showing LED behavior.

5. Front panel LED is controlled by BMC or Microchip CEC1702. Once Microchip CEC1702 is working(Auth or recovery), the front panel LED is controlled by Microchip CEC1702 and vice versa.

Pre-installation Instructions

Computer components and electronic circuit boards can be damaged by electrostatic discharge. Working on computers that are still connected to a power supply can be extremely dangerous. Follow the simple guidelines below to avoid damage to your computer or injury to yourself.

• Always disconnect the computer from the power outlet whenever you are working inside the computer case.

• If possible, wear a grounded wrist strap when you are working inside the computer case. Alternatively, discharge any static electricity by touching the bare metal system of the computer case, or the bare metal body of any other grounded appliance.

• Hold electronic circuit boards by the edges only. Do not touch the components on the board unless it is necessary to do so. Do not flex or stress the circuit board.

• Leave all components inside the static-proof packaging until you are ready to use the component for the installation.
3-1   Removing and Installing the Chassis Top Cover

Before you remove or install the chassis top cover
  • Make sure the system is not turned on or connected to AC power.

Follow these instructions to remove/install the chassis top cover:

Front Cover
1. Push button to unlock the handle.
2. Pull the grip handle to open the panel cover.
3. Slide the cover towards the front of the system and then remove the cover in the direction indicated by the arrow.
4. Follow steps 1-3 in reverse order to re-install the front top cover

Rear Cover
1. Loosen the two thumbnail screws securing the chassis cover.
2. Slide the cover towards the rear of the system and then remove the cover in the direction indicated by the arrow.
3. Follow steps 1-2 in reverse order to re-install the rear top cover
3-2 Removing and Installing the GPU Tray

Before you remove or install the GPU tray:
• Make sure the system is not turned on or connected to AC power.

Follow these instructions to remove/install the GPU tray:
1. Loosen the top thumbnail screw securing the handles on both sides of the system.
2. Pull the grip handles on both sides of the system slide the tray to the front of the system at the same time to pull out the tray.
3. Slide the white latch on both sides of the tray rail and carefully remove the GPU tray.
4. To reinstall the GPU tray, align it with the rails on both sides and push the blue latches on each side of the tray rail backward to slide it into the system. Then, reverse steps 1-2 to secure the GPU tray in position.

System in the cabinet
1. Loosen the thumbnail screws securing the handles on both sides of the system.
2. Pull the grip handles on both sides of the system slide the tray to the front of the system at the same time to remove the tray.
3. Follow steps 1-2 in reverse order to re-install the GPU tray.
3-3 Removing the Heat Sink

Read the following guidelines before you begin to remove/install the heat sink:

- Always turn off the computer and unplug the power cord from the power outlet before installing the heat sink to prevent hardware damage.
- Unplug all cables from the power outlets.
- Disconnect all telecommunication cables from their ports.
- Place the system unit on a flat and stable surface.
- Open the system according to the instructions.

**WARNING!**

Failure to turn off the server before you start installing components may cause serious damage. Do not attempt the procedures described in the following sections unless you are a qualified service technician.

Follow these instructions to remove/install the heat sink:

1. Loosen the captive screws securing the heat sink in place in reverse order (4 → 3 → 2 → 1). Move the rotating wires into the unlatch position.
2. Lift and remove the heat sink from the system.
3. To reinstall the heat sink reverse steps 1-2 while ensuring that you tighten the captive screws in sequential order (1 → 2 → 3 → 4).

- When installing the heat sink to CPU, use T30-Lobe driver to tighten 4 captive nuts in sequence as 1-4. Please refer to the Heatsink Label for the screw tightening torque value.
- To ensure the system operates properly, make sure the heat sink is seated on the processor firmly.
Installing the CPU

Read the following guidelines before you begin to install the CPU:

- Make sure that the motherboard supports the CPU.
- Always turn off the computer and unplug the power cord from the power outlet before installing the CPU to prevent hardware damage.
- Unplug all cables from the power outlets.
- Disconnect all telecommunication cables from their ports.
- Place the system unit on a flat and stable surface.
- Open the system according to the instructions.

**WARNING!**

Failure to properly turn off the server before you start installing components may cause serious damage. Do not attempt the procedures described in the following sections unless you are a qualified service technician.

Follow these instructions to Install the CPU:

1. Align and install the processor on the carrier.
   **NOTE:** Apply thermal compound evenly on the top of the CPU. Remove the protective cover from the underside of the heat sink.
2. Carefully flip the heat sink cover. Then install the carrier assembly on the bottom of the heat sink and make sure the gold arrow is located in the correct direction.
3. Remove the CPU cover.
   **NOTE:** Save the CPU cover in the event that you need to remove the CPU from the socket.
4. Align the heat sink with the CPU socket by the guide pins and make sure the gold arrow is located in the correct direction. Then place the heat sink onto the top of the CPU socket.
5. Position the rotating wires into the latch position. Tighten the screws in sequential order (1→2→3→4).
   **NOTE:** When disassembling the heat sink, loosen the screws in reverse order (4→3→2→1) and then move the rotating wires into the unlatch position.

NOTE!

- The carrier code is marked on each carrier and matches a code laser marked on to the IHS (Integrated Heat Spreader) to ensure the right parts are used together.
- When installing the heatsink to CPU, use T30-Lobe driver to tighten 4 captive nuts in sequence as 1-4.
- Please refer to the Heatsink Label for the screw tightening torque value.
3-5 Installing the Memory

Read the following guidelines before you begin to install the memory:

• Make sure that the motherboard supports the memory. It is recommended that memory of the same capacity, brand, speed, and chips be used.
• Always turn off the computer and unplug the power cord from the power outlet before installing the memory to prevent hardware damage.
• Memory modules have a foolproof design. A memory module can be installed in only one direction. If you are unable to insert the memory, switch the direction.

3-5-1 Eight Channel Memory Configuration

This motherboard provides 32 DDR5 memory slots and supports 8-Channel Technology. After the memory is installed, the BIOS will automatically detect the specifications and capacity of the memory.
3-5-2 Installing the Memory

Before installing a memory module, make sure to turn off the computer and unplug the power cord from the power outlet to prevent damage to the memory module.

Be sure to install DDR5 DIMMs on this motherboard.
Make sure your DIMM slots have a single latch or a double latch.

Follow these instructions to install a DIMM module with Single Latch:

1. Open the plastic latch of the memory slot, then place the memory module as pre-inserted vertically position.

2. Hold it with both hands, insert the memory module into the movable end first, and then insert the memory module into the fixed end.

3. Then use both hands to insert the memory module vertically into the DIMM slot and push it down. Close the plastic latch at the edge of the DIMM slots to lock the memory module.

4. Reverse the installation steps when you want to remove the memory module.

Follow these instructions to install a DIMM module with Double Latch:

1. Insert the DIMM memory module vertically into the DIMM slot and push it down.
2. Close the plastic clip at both edges of the DIMM slots to lock the DIMM module.
3. Reverse the installation steps when you want to remove the DIMM module.

3-6 Installing the PCI Expansion Card

- Voltages can be present within the server whenever an AC power source is connected. This voltage is present even when the main power switch is in the off position. Ensure that the system is powered-down and all power sources have been disconnected from the server prior to installing a PCIe card.
- Failure to observe these warnings could result in personal injury or damage to equipment.

Follow these instructions for a PCI Expansion card:

PCle Card Cage

1. Press the release latch.
2. Simultaneously pulling up the tray handle for the PCIe card cage.
3. Pull the cage out of the system.
4. Align the PCIe card onto the slot and push in the direction of the arrow until the PCIe card sits in the PCIe card connector.
5. Secure the PCIe card with the screw.
6. To install the PCIe card cage, push the cage back into the system. Reverse the previous steps to remove the PCI expansion card.
Rear System PCIe Card

1. Loosen the screw securing the riser bracket.
2. Gently lift the riser bracket. Then, move it backward and lift it upward.
3. Remove the screw securing the slot cover from the riser bracket.
4. Remove the slot cover from the riser bracket.
5. Orient the PCIe card with the riser guide slot and push in the direction of the arrow until the PCIe card sits in the PCIe card connector.
6. Secure the PCIe card with the screw.
7. Reverse the previous steps to install the riser bracket.
Installing the Hard Disk Drive

Read the following guidelines before you begin to install the hard disk drive:

- Take note of the drive tray orientation before sliding it out.
- The tray will not fit back into the bay if inserted incorrectly.
- Make sure that the hard disk drive is connected to the hard disk drive connector on the backplane.

Follow these instructions to install a 2.5" hard disk drive:

1. Press the release button.
2. Extend the locking lever.
3. Pull the locking lever in the direction indicated to remove the HDD tray.
4. Align the hard disk drive with the positioning stud on the HDD tray.
5. Slide the hard disk drive into the HDD tray.
6. Reinsert the HDD tray into the slot and close the locking lever.
3-8 Replacing the System Fan Module

CAUTION!
Before you remove or install the system fans follow these steps:
• Disconnect all necessary cable connections. Failure to observe these warnings could result in personal injury or damage to the equipment

Follow these instructions to replace the fan assembly:
1. Flip and then grasp the handle and simultaneously press the retaining clip on the bottom side of the fan module in the direction indicated.
2. Pull out the fan module.
3. Reverse the previous steps to install the replacement fan module.

Internal System Fan
1. Lift up the fan assembly from the chassis.
2. Reverse the previous steps to install the replacement fan assembly.
3-9 Removing and Installing the Power Supply

CAUTION!

Please see Section 2-2 "Rear View" for installation sequence.

Follow these instructions to replace the power supply:

1. Flip and then grasp the power supply handle.
2. Press the retaining clip on the right side of the power supply in the direction indicated.
3. Pull out the power supply using the handle.
4. Insert the replacement power supply firmly into the chassis. Connect the AC power cord to the replacement power supply.
3-10  **Installing the System into the Cabinet**

Read the following guidelines before you begin to install the system into the cabinet:

- Make sure the system is not turned on or connected to AC power.
- A Lift Table is required. Place the system unit on Lift Table.
- Four Person lift required. Firmly hold the bottom of the system when required to lift and carry the system.
- Failure to observe these warnings could result in personal injury or damage to the equipment.

**Follow these instructions to install the system into the cabinet:**

1. Pull out and release the thumbnail screw securing the chassis handle in place.
2. Remove the four handles on each side of the system.
3. Carefully slide the system into the cabinet.
3-11 Removing the System from the Cabinet

Read the following guidelines before you begin to remove the system from the cabinet:

- Always turn off the computer and unplug the power cord from the power outlet before removing the system from the cabinet.
- Disconnect all necessary cable connections.
- A Lift Table is required. Place the system unit on Lift Table.
- Four Person lift required. Firmly hold the bottom of the system when required to lift and carry the system.
- Failure to observe these warnings could result in personal injury or damage to the equipment.

Follow these instructions to remove the system from the cabinet:

1. Loosen the thumbnail screws on each side that secure the system.
2. Carefully pull out the system from the cabinet and stop at the security hook on the side of the system.
3. Push the button to unlock.
4. Gently pull out the system from the cabinet and place it on Lift table.
Follow these instructions to install the chassis handles on the system:

1. Attach the four chassis handles to the system.
2. Push and lock the thumbnail screw to secure the chassis handle in place.

NOTE!
- Before lifting the system, installing the four chassis handles on the system is required.

**NOTE!**

*Base on CPU configuration*
**NOTE!**

- **ME_RCVR**: Setting "ME_RCVR" to [2-3] will force the system's Management Engine into recovery mode. This allows the user to update the BIOS image, including the Management Engine region. Note that this jumper does not need to be set when using the Gigabyte BIOS update utility and SOP.
- **S3 Mask**: Reserve for development only.
- **BIOS Recovery** please refer to page 116.
- **CLR_CMOS** used to reset the BIOS settings of a computer to their default values.
- **PASS_CLEAR** used to clear or reset the BIOS password, which can be necessary if you've forgotten the password and need to regain access to the system.

Chapter 5  BIOS Setup

BIOS (Basic Input and Output System) records hardware parameters of the system in the EFI on the motherboard. Its major functions include conducting the Power-On Self-Test (POST) during system startup, saving system parameters, loading the operating system etc. The BIOS includes a BIOS Setup program that allows the user to modify basic system configuration settings or to activate certain system features. When the power is turned off, the battery on the motherboard supplies the necessary power to the CMOS to keep the configuration values in the CMOS.

To access the BIOS Setup program, press the <DEL> key during the POST when the power is turned on.

- BIOS flashing is potentially risky, if you do not encounter any problems when using the current BIOS version, it is recommended that you don’t flash the BIOS. To flash the BIOS, do it with caution. Inadequate BIOS flashing may result in system malfunction.
- It is recommended that you not alter the default settings (unless you need to) to prevent system instability or other unexpected results. Inadequately altering the settings may result in system's failure to boot. If this occurs, try to clear the CMOS values and reset the board to default values. (Refer to the Exit section in this chapter or introductions of the battery/clearing CMOS jumper in Chapter 4 for how to clear the CMOS values.)

Main
This setup page includes all the items of the standard compatible BIOS.

Advanced
This setup page includes all the items of AMI BIOS special enhanced features.
(ex: Auto detect fan and temperature status, automatically configure hard disk parameters.)

Chipset
This setup page includes all the submenu options for configuring the functions of the Platform Controller Hub.

Server Management
Server additional features enabled/disabled setup menus.

Security
Change, set, or disable supervisor and user password. Configuration supervisor password allows you to restrict access to the system and BIOS Setup.
A supervisor password allows you to make changes in BIOS Setup.
A user password only allows you to view the BIOS settings but not to make changes.

Boot
This setup page provides items for configuration of the boot sequence.

Save & Exit
Save all the changes made in the BIOS Setup program to the CMOS and exit BIOS Setup. (Pressing <F10> can also carry out this task.)
Abandon all changes and the previous settings remain in effect. Pressing <Y> to the confirmation message will exit BIOS Setup. (Pressing <Esc> can also carry out this task.)
5-1 The Main Menu

Once you enter the BIOS Setup program, the Main Menu (as shown below) appears on the screen. Use arrow keys to move among the items and press <Enter> to accept or enter other sub-menu.

Main Menu Help
The on-screen description of a highlighted setup option is displayed on the bottom line of the Main Menu.

Submenu Help
While in a submenu, press <F1> to display a help screen (General Help) of function keys available for the menu. Press <Esc> to exit the help screen. Help for each item is in the Item Help block on the right side of the submenu.

- When the system is not stable as usual, select the **Restore Defaults** item to set your system to its defaults.
- The BIOS Setup menus described in this chapter are for reference only and may differ by BIOS version.

**Parameter** | **Description**
--- | ---
- Parity  
  - A parity bit can be sent with the data bits to detect some transmission errors.  
  - Even: parity bit is 0 if the num of 1’s in the data bits is even.  
  - Odd: parity bit is 0 if num of 1’s in the data bits is odd.  
  - Mark: parity bit is always 1. Space: Parity bit is always 0.  
  - Mark and Space Parity do not allow for error detection.  
  - Options available: None, Even, Odd, Mark, Space. Default setting is None.
- Stop Bits  
  - Stop bits indicate the end of a serial data packet. (A start bit indicates the beginning). The standard setting is 1 stop bit. Communication with slow devices may require more than 1 stop bit.  
  - Options available: 1, 2. Default setting is 1.
- Flow Control  
  - Flow control can prevent data loss from buffer overflow. When sending data, if the receiving buffers are full, a 'stop' signal can be sent to stop the data flow. Once the buffers are empty, a 'start' signal can be sent to re-start the flow. Hardware flow control uses two wires to send start/stop signals.  
  - Options available: None, Hardware RTS/CTS. Default setting is None.
- VT-UTF8 Combo Key Support  
  - Enable/Disable the VT-UTF8 Combo Key Support.  
  - Options available: Enabled, Disabled. Default setting is Enabled.
- Recorder Mode  
  - When this mode enabled, only texts will be send. This is to capture Terminal data.  
  - Options available: Enabled, Disabled. Default setting is Disabled.
- Resolution 100x31  
  - Enable/Disable extended terminal resolution.  
  - Options available: Enabled, Disabled. Default setting is Enabled.
- Putty KeyPad  
  - Selects Function Key and KeyPad on Putty.  
  - Options available: VT100, LINUX, XTERMR6, SC0, ESCN, VT400. Default setting is VT100.

### Security Menu

The Security menu allows you to safeguard and protect the system from unauthorized use by setting up access passwords.

There are two types of passwords that you can set:
- **Administrator Password**
  
  Entering this password will allow the user to access and change all settings in the Setup Utility.

- **User Password**
  
  Entering this password will restrict a user’s access to the Setup menus. To enable or disable this field, a Administrator Password must first be set. A user can only access and modify the System Time, System Date, and Set User Password fields.

5-5-1 Secure Boot

The Secure Boot feature is applicable if supported by your Operating System. If your Operating System is not supporting Secure Boot, the system will hang when starting the Operating System.

### Parameter | Description
--- | ---
System Mode | Displays if the system is in User mode or Setup mode.
Secure Boot | Enable/Disable the Secure Boot function. Options available: Enabled, Disabled. Default setting is **Disabled**.
Secure Boot Mode | Secure Boot requires all the applications that are running during the booting process to be pre-signed with valid digital certificates. This way, the system knows all files being loaded before the Operating System loads to the login screen have not been tampered with. When set to Standard, it will automatically load the Secure Boot keys form the BIOS databases. When set to Custom, you can customize the Secure Boot settings and manually load its keys from the BIOS database. Options available: Standard, Custom. Default setting is **Custom**.
Restore Factory Keys | Forces the system to user mode and installs factory default Secure Boot key database.
Reset To Setup Mode | Reset the system to Setup Mode.

(Note) Advanced items prompt when this item is set to **Custom**.
Press [Enter] to configure advanced items.

**Please note that this item is configurable when Secure Boot Mode is set to Custom.**

- **Factory Key Provision**
  - Allows to provision factory default Secure Boot keys when system is in Setup Mode.
  - Options available: Enabled, Disabled. Default setting is **Disabled**.

- **Restore Factory Keys**
  - Installs all factory default keys. It will force the system in User Mode.
  - Options available: Yes, No.

- **Reset To Setup Mode**
